

# Egress Switch Secure Web Form

Third parties regularly need a secure single point of contact to share or receive sensitive information, including large files, with specific users and teams within an organisation. Often, however, what should be a simple data sharing process requires significant administrative overheads to process information and files upon arrival within a corporate network. Moreover, when shared via cleartext email or file transfer sites, organisations and third parties have no way to protect, audit and control sensitive data, leaving them vulnerable to data breaches.

## The benefits

- Secure data throughout its lifecycle
- Track data entering your organisation through detailed audits and reports
- Free for your third parties to use
- Fully customisable based on your information sharing requirement
- Easy-to-use encryption – no account sign up required
- Optional enhanced security with third party verification
- Secure shared data regardless of file size
- Brand in line with corporate guidelines
- Flexible and secure web hosting options
- No infrastructure required in hosted implementations
- Enhanced efficiency and cost saving by reducing the time taken to share data

## Secure information sharing made simple

Switch Secure Web Form manages the lack of security between hosted web services or cleartext email and a corporate network, ensuring sensitive information is protected and controlled as it flows into an organisation

Each web form can be tailored to match an organisation's specific secure data sharing requirement, including the fields needed to populate the form, as well as corporate branding and language. In addition, Switch Secure Web Form can be accessed via mobile devices, meaning users can secure sensitive information on the move.

To further simplify this data sharing process, third parties do not need to sign up for an Egress Switch account in order to securely submit information and files using Switch Secure Web Form. However, an Egress Switch ID or other information known only to the end-user can be used for third party verification.

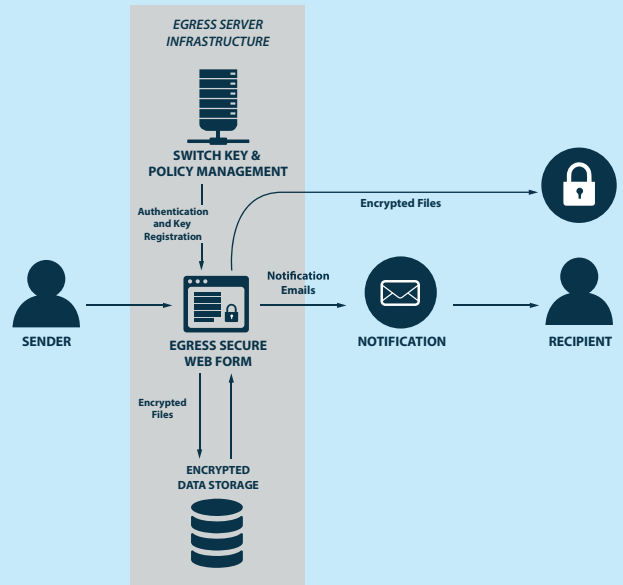

## Flexible web hosting options

Switch Secure Web Form supports flexible hosting via either an organisation's own corporate site or its outsourced IT provider, or through secure third party hosting. As such, Switch Secure Web Form helps organisations to manage regulation and compliance rules in conjunction with existing IT infrastructure, and cost and efficiency overheads.

## Sophisticated internal management

Offering full audit capabilities, including time and date reporting, Switch Secure Web Form enables organisations to track the information entering their network. In addition, sophisticated data security functionality means organisations can, if necessary, restrict uploads by file type and size, while integration with AV scanners facilitates continued network-edge security.

Switch Secure Web Form can also be used to populate existing workflows, including Egress Switch Secure Workspace, or publish information to MS Word or PDF documents to aid efficiency by reducing the administrative overhead needed to process this data.
